

Extract MSG File

Description

This app extracts attachments from MSG files, compiles them into a folder, and outputs that folder through the outgoing connection. The original job is discarded (sent to null) so that the newly created folder replaces it in the workflow.

Compatibility

Switch Fall 2023 and later.

Connections

The app includes an incoming connection and a traffic light output connection:

- If the job contains multiple files or the MSG file cannot be read, the job is sent to the red error connection.
- If attachments are successfully extracted, they are compiled into a folder and sent to the green success connection, while the original job is discarded.
- If the MSG file contains no attachments, the initial job is sent to the green success connection.

Properties detailed info

No configurable properties.

Outgoing connections properties

No properties for outgoing connections.
